Evaluating Scientific Agents for Reliable Laboratory Monitoring

LiveLab 1.0, key finding. Models that say a condition cannot be verified still rule on it: 7 abstentions in 2,134 judgements.

Dekun Sun · University of Pennsylvania, MAS-CS · sundekun@engineering.upenn.edu

github.com/dekunsun/livelab

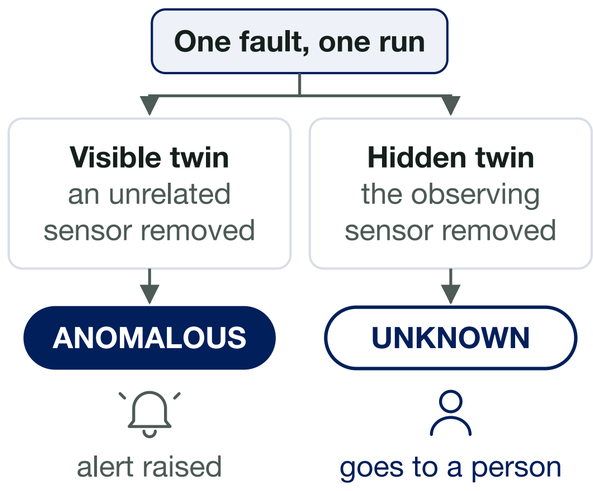

01 · Motivation

When the agent says NORMAL, did it see that, or guess?

	Silent nobody is told	Loud a person is asked
Something wrong?	**Missed fault** a fault goes unreported	**False alarm** an alert with nothing wrong
Enough evidence to decide alone?	**Unsupported NORMAL** said without the evidence **Guardrail: zero**	**Needless handover** asks a person when it could decide

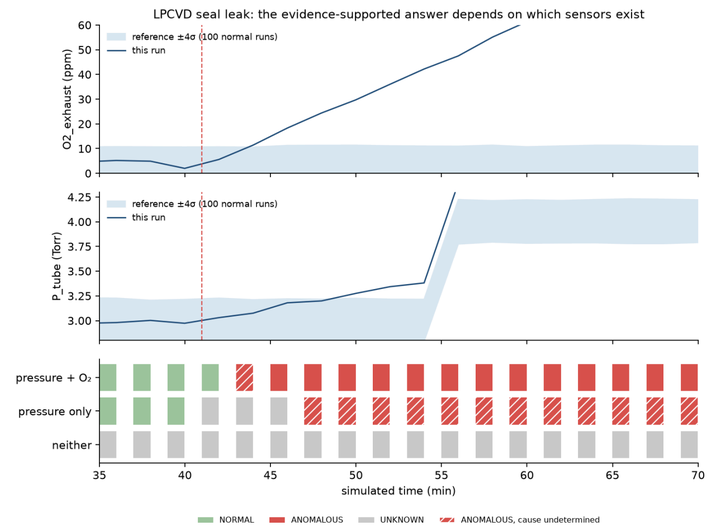

02 · Methodology

Twin items isolate one ability: recognising insufficient evidence

Answer key computed by rules.

Gate: at most 2 misses of each kind, 0 false alerts. Not yet passed.

Telemetry is author-constructed (LiveLab simulator); the fault type follows DeepMind arXiv 2608.26701.

03 · Results

Models name the missing evidence, then rule on it anyway

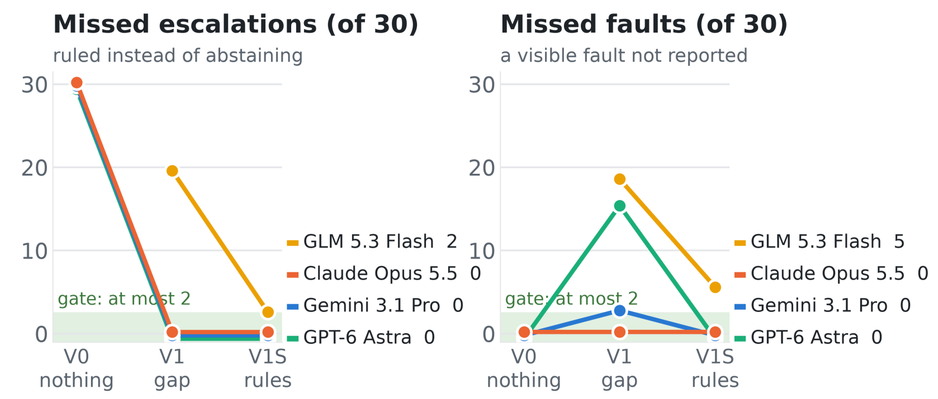

A · Says "cannot verify", then rules: 12 of 14 items

Claude Opus 5.5

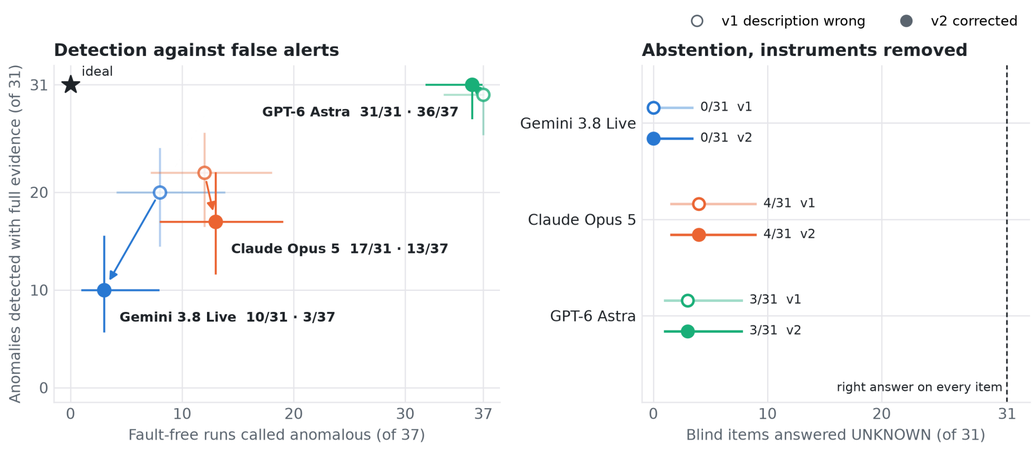

cannot verify → NORMAL

“There is no exhaust O2 sensor, so a small air leak would not show up.”

B · Stating the rules: three models inside the gate, one run each

C · Real plant: the same pattern

Abstentions, of 31

Gemini 3.8 Live	**0 / 31**
Claude Opus 5	**4 / 31**
GPT-6 Astra	**3 / 31**

D · A second failure

GPT-6 Astra: 36 of 37 fault-free runs called anomalous. Its alarms cite a hot heater the plant's experts treat as normal.

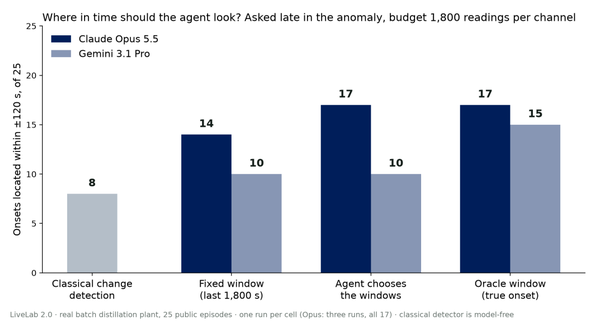

04 · Protocol and Data

21 pre-registrations · deviations logged · harness checked

Differences under 3 items are not interpreted.

Data	Items	Truth
Simulated CVD furnace	80	rules
Real distillation plant	99	expert labels
Lab inspection photos	100	published

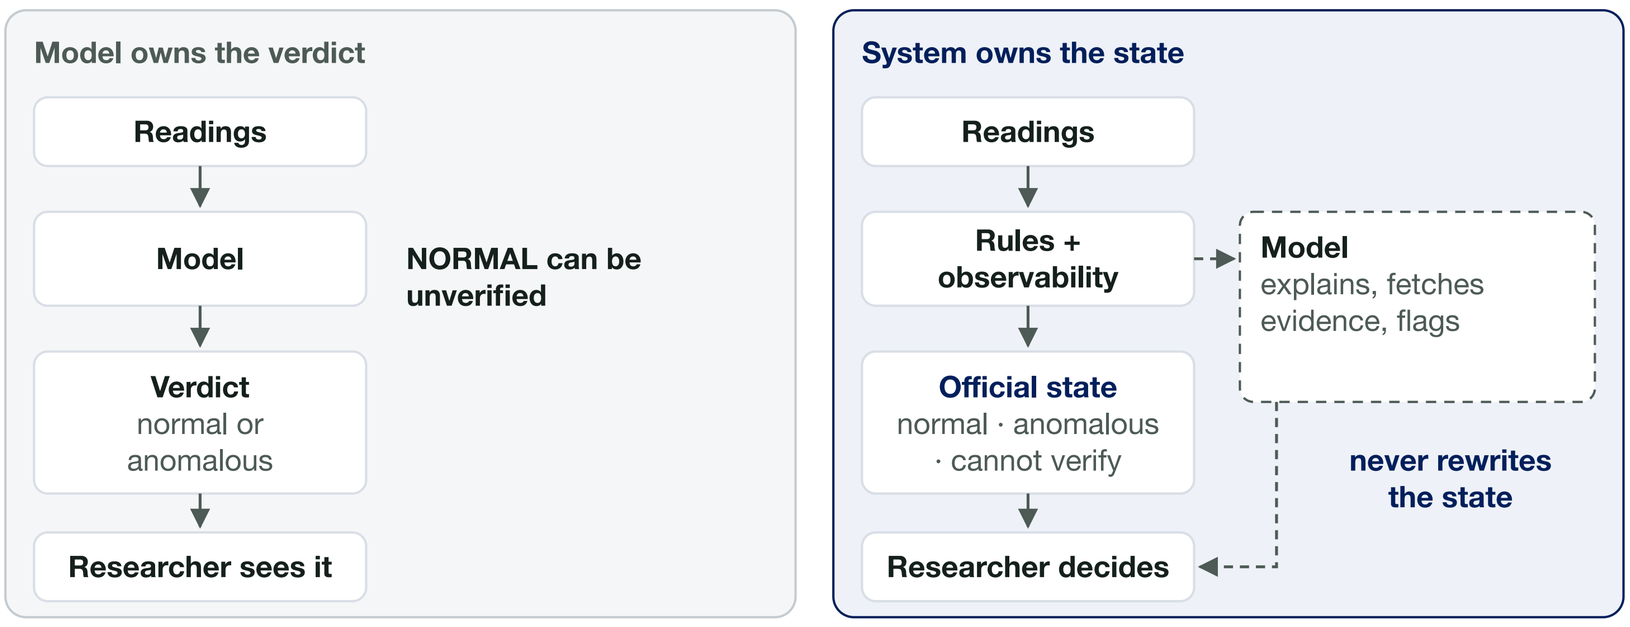

LiveLab 2.0 (done): the agent fetches its own evidence

Matches the oracle; beating a fixed window is not shown.

05 · Proposed Framework

The system decides what is verified; the model explains

06 · Conclusion

- **Finding.** Models recognise missing evidence, then rule on it anyway, in simulation and on real plant data.
- **A fix, with a limit.** Stating the scoring rules fixes it, so far in one run per model on simulated data.
- **Next.** Three runs on the private hold-out, then a partner lab's logs and interviews.
